DETAILED ACTION

Continued Examination Under 37 CFR 1.114

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 2/2/06 has been entered.

Claim Rejections - 35 USC § 102

2. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

3. Claims 1-21 are rejected under 35 U.S.C. 102(b) as being anticipated by Uz et al (5,847,761).

Uz et al, in Figures 1, 3, 5, 7, and 8, discloses a method for performing rate control in a video encoder that is the same system and method for encoding a stream of data blocks using a scalable encoder as specified in claims 1-21 of the present invention, the method comprising the steps of receiving a stream of data blocks 200; storing the received data blocks in a buffer 50'; encoding a first sequence of the stored data blocks from the buffer to produce a first encoded data block 80; monitoring the fullness level of the buffer 302 for comparison with a predetermined threshold range

(Fig. 8A); and adjusting the complexity 90' of the encoder 80 based on only the comparison outcome of the input buffer, the adjusting according to a predetermined encoding configuration table (e.g. Q factors table), the configuration table using a plurality of complexities and encoding options.

With respect to claims 2-21, Uz et al also discloses the step of decreasing or increasing the complexity of the encoder when the fullness level of the buffer exceeds an upper limit or is below a lower level of the predetermined threshold range, respectively (Fig. 8A); encoding a second data block at the decreased or increased complexity to produce a second encoded data block (e.g. frame I); maintaining the complexity of the encoder when the fullness level of the buffer falls within the predetermined threshold range; and storing the first encoded data blocks in a memory medium (e.g. disk) for subsequent retrieval; wherein the fullness level of the buffer is determined based on an input rate of the stream of video frames and processing feedback information from the encoder 80 after producing the first encoded data block.

Response to Arguments

4. Applicant's arguments with respect to claims 1-21 have been considered but are moot in view of the new ground(s) of rejection.
